

Music Data Visualization Report

Descriptive Statistics (Popularity):

count: 2000.0
mean: 50.5305
std: 28.936892397436363
min: 0.0
25%: 26.0
50%: 51.0
75%: 75.0
max: 100.0

Inferential Analysis (T-Test: pop vs. rock):

Genre A: pop, Average Popularity: None

Genre B: rock, Average Popularity: None

T-statistic: None

P-value: None

Analysis Methods Used:

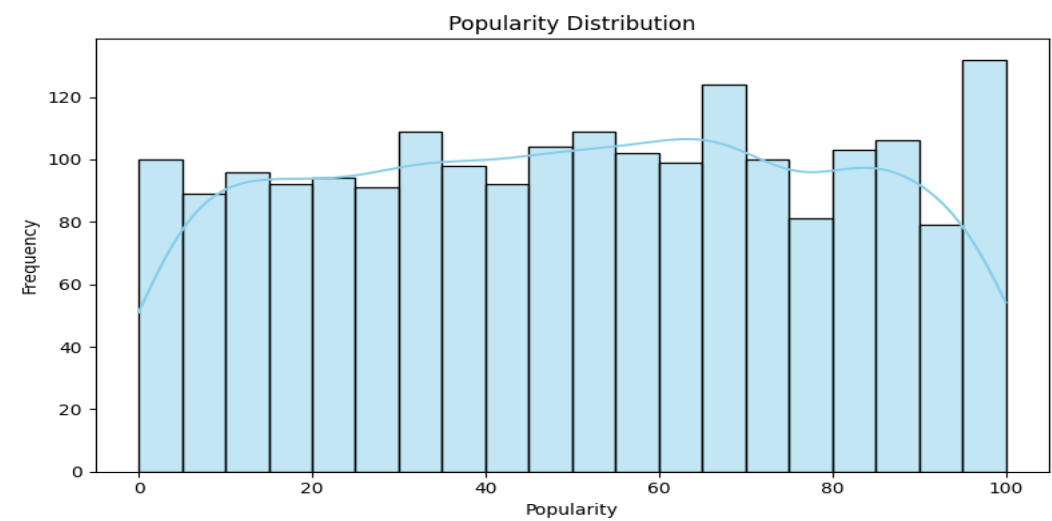

- Descriptive Statistics: Summary measures (mean, median, std, etc.) for song popularity.
- Inferential Statistics: A t-test was performed to compare average popularity between pop and rock genres.
- Machine Learning: K-Means clustering was applied on a feature set extracted from the dataset (in our case, we focused on genres and popularity as proxy features) to group songs into clusters.
- Visualization: Various plots (bar plots, histograms, boxplots) were generated to provide insight into genre distribution, popularity distribution, and artist frequency.
